5,000
Month-12 active-user target

INVESTMENT MEMORANDUM

13 October 2026 | Pre-revenue funding proposal | USD

$400k to the owner for existing shares; $1.6m to Tazdan for its first 1-3 years.
Same-price proposal: $18.4m pre-money / $20m post-money.
Growth, revenue and the funding horizon are modeled objectives, conditional on costs, approvals and execution.

The investment in one page

Tazdan already has the integrated software foundation of a fintech platform. The funding opportunity is to turn that foundation into a trusted, licensed money service with measurable customer activity and repeat transaction revenue.

$2.44m

Upper engineering reproduction-cost estimate [I1]

5,000

Modeled monthly active users by month 12

$49.2k

Base month-12 revenue; scenario, not traction

What exists	What investment unlocks
Mobile consumer app, business payouts, public API and staff operations	Licensed partner activation, safeguarding arrangements and commercial distribution
Ledger, risk, treasury, reconciliation and release controls	Independent assurance, current release acceptance and controlled real-money pilot
Libya-focused FX and 12 sandbox remittance corridors	First approved live corridor, actual settlement economics and recurring customer usage

The proposed transaction

$2.0 million total for 10% ownership: $400,000 paid to the founder/owner for existing shares and $1,600,000 invested into Tazdan to support its first 1-3 years. At the same share price, this comprises 2% purchased from the owner plus 8% newly issued, measured fully diluted after closing. Implied valuation: $18.4m pre-money / $20m post-money; final cap table and rights to be agreed.

The business thesis

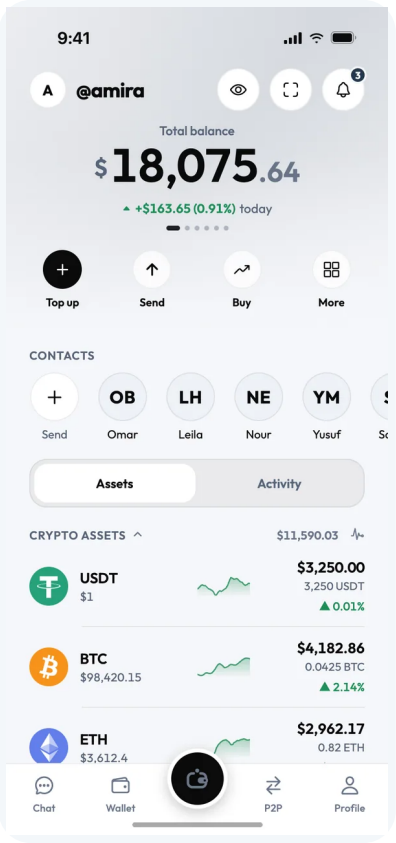

Start with a focused Libya corridor and repeat users: households moving money, diaspora families supporting relatives, and businesses paying Tazdan customers. Earn disclosed spread and transaction fees; use wallets, chat and business tools to drive retention. Add corridors and issuer products only after the first economics and controls work in production.

Base case at month 12: $49,175 revenue, 70.2% gross margin and a $4,806 operating loss after team, compliance and acquisition spending. At the same unit economics and acquisition intensity, operating break-even is approximately 5,920 active users.

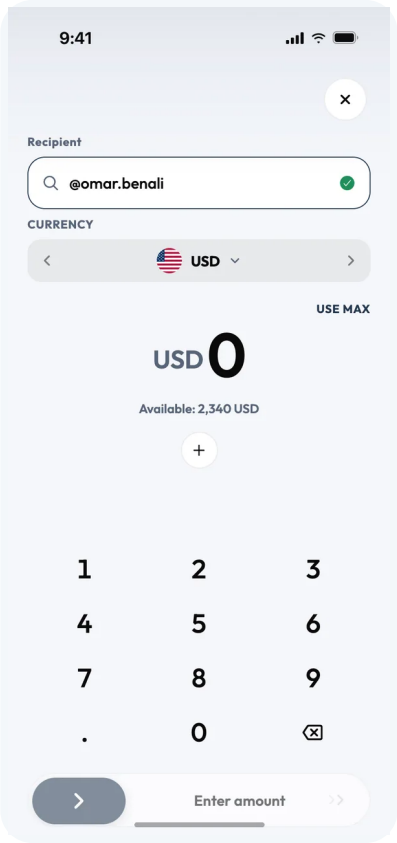

Pre-revenue status is supplied in the founder brief. No verified production user, revenue, partner-contract or audit traction is represented. Technology cost estimates and the proposed equity valuation are separate measures.

The app: everyday money

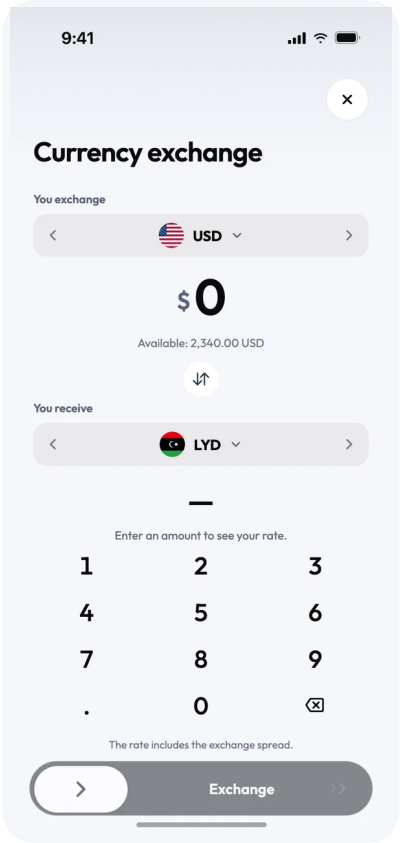

Repository-supplied app captures. Displayed balances, prices and identities are sample UI data, not financial evidence.

Wallet and portfolio
Balances, assets and activity.

Send money
Recipient and amount flow.

Exchange
Asset discovery and trading.

One customer relationship, several repeat uses

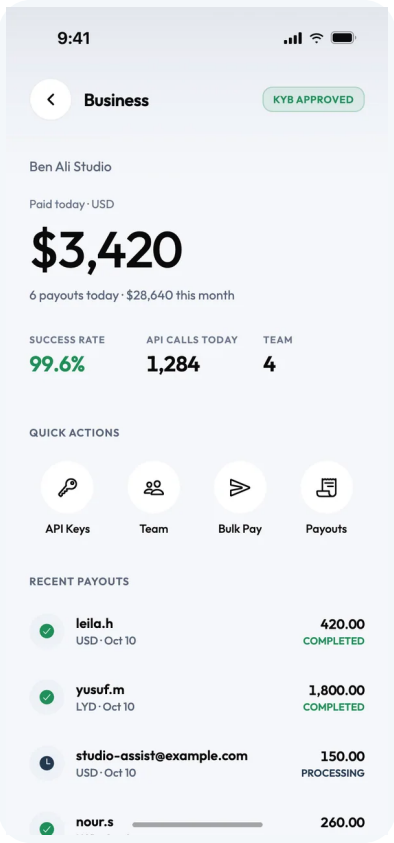

The app brings funding, wallet balances, internal payments, conversion, transaction history and support into a single interface. Local language, clear payment confirmations and a usable operations backend are part of the product value.

Households use wallets and internal payments. Diaspora families use cross-border transfers after corridor activation. Traders use quoted conversion within approved products and risk limits.

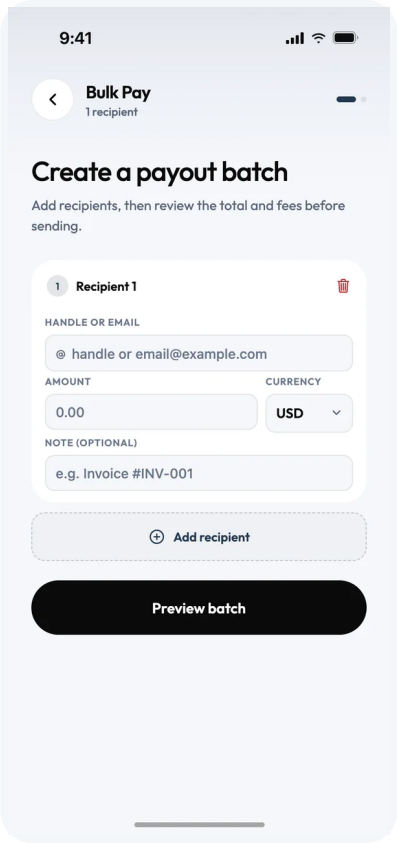

Screens show the product experience; code implementation and UI presence do not establish a live licensed service. Production money features are explicitly gated. [I2-I5]

Business and cross-border journeys

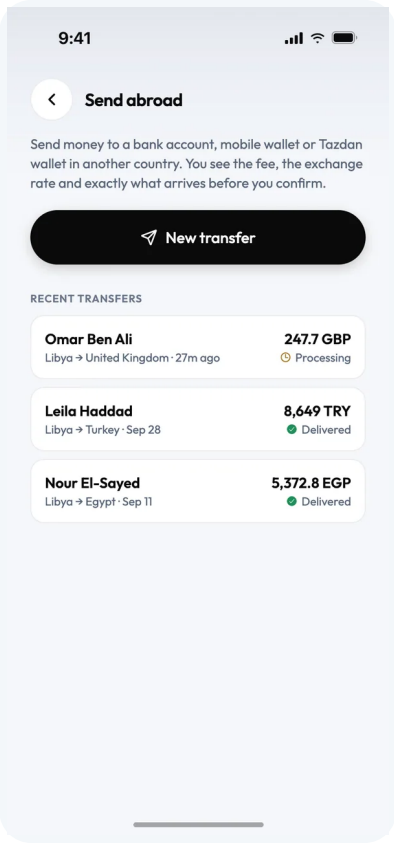

Actual app assets supplied with the repository. The remittance flow currently operates against sandbox rails.

Business dashboard
Account and payment activity.

Bulk payouts
Pay multiple Tazdan users.

Send abroad
Partner activation required.

Business volume can deepen the customer network

Businesses have KYB review, teams, approval workflows and batch payouts. A business can pay workers, suppliers or other recipients who are Tazdan customers. The public API supports integration with business systems; signed webhooks report payout outcomes.

The cross-border engine adds beneficiary records, auditable quotes, screening, routing, treasury reservations, payout status, refunds and reconciliation. Twelve corridor configurations cover Libya in both directions with the UK, euro area, Egypt, Turkey, UAE and Tunisia.

Screenshot assets: client/public/app/screens/en-light/{business-home,business-bulk,remit}.webp. Business capabilities [I4]; cross-border state and pricing [I5].

How the business will operate

1. Acquire and verify
   A customer registers, completes required checks and agrees the approved terms.

2. Fund and quote
   A supported bank or approved rail funds the wallet; Tazdan presents the executable price and fee.

3. Reserve and route
   The ledger reserves funds; risk and limits determine whether to proceed or review.

4. Deliver and record
   Internal credit or activated partner payout completes; earned fees and spread are recorded.

5. Reconcile and retain
   Provider statements and ledgers reconcile; support, history and repeat use close the loop.

The proposed launch structure

Tazdan operates the product, technology, customer journey and control workflows. Authorised entities and contracted banks, payout providers and liquidity venues perform the regulated activities within their agreed legal scope. Entity structure, allocation of compliance duties and customer-fund ownership must be fixed in contracts before activation.

Money and revenue are accounted for separately

Customer balances and transfer principal are obligations or settlement flows. Revenue consists of earned fees and spread, not the value of money passing through the system. Corporate capital funds operating expenses and prefunding; customer funds are not a source of business profit or funding.

This is the proposed commercial operating model, not a statement that approvals or contracts already exist. Manual bank confirmation and payout operations require named staff, cutoffs and daily close procedures. [I3-I6]

Technology worth building on

97
Prisma data models

85
Mobile route files, excluding layouts

55
Web page routes; 33 in admin

Current static review also finds 57 migrations and approximately 139,000 application source lines across server, mobile and web, including tests. Breadth is supported by the workflows and controls below; line count is not a valuation method.

Layer	Integrated capabilities	Commercial implication
Customer surfaces	Expo iOS/Android; Next.js web; business and staff interfaces	Several customer segments share one financial core.
Money core	PostgreSQL-enforced double entry; holds; conditional transitions; append-only evidence	Money movement can be traced and operational exceptions investigated.
FX and delivery	Fulus-referenced LYD maker; immutable quotes; provider routing; treasury and reconciliation	Pricing and delivery can be managed independently of a single rail.
Risk and operations	17-rule risk engine; screening; cases; 12 staff roles/49 permissions; dual control	Operational and compliance work is embedded in the platform.
Release and recovery	Production evidence gates; kill switches; monitoring; migration and recovery tools	Controlled activation rather than broad automatic enablement.

The premium is integration and time saved

A new entrant would need to assemble consumer experience, accounting, settlement, risk, support and staff workflows together. Tazdan gives an investor an existing integrated starting point. Provider flexibility, local product knowledge and business APIs support a premium positioning; distribution and liquidity network effects still need to be earned.

Counts are a 13 October 2026 working-tree inventory, not a production benchmark. Historical 151 passing server tests were reported on 7 October; tests and capacity were not rerun for this memorandum. [I1-I3,I6-I8]

A strong technology value case

Up to approximately $2.4 million estimated engineering reproduction cost provides a substantial, documented foundation for the technology discussion. It excludes licences, live partner activation and independent assurance, all of which can add to the cost of recreating a commercial platform.

Reproduction scenario	Effort × fully loaded cost	Estimated cost
Lower	72 engineer-months × $12,000	$864,000
Midpoint illustration	97 engineer-months × $16,000	$1,552,000
Upper	122 engineer-months × $20,000	$2,440,000

Source: internal engineering effort estimate [I1]. Effort is judgement-based, not time-sheet expenditure. International specialist-team economics are assumed; local or AI-assisted delivery may cost less. U.S. BLS reports a $133,080 median developer wage for May 2024, a salary benchmark rather than a turnkey fintech build quote. [E1]

What the investor is buying exposure to

- An integrated platform: ledger, customer apps, business tools, operator controls and provider orchestration.
- A faster commercial starting point: the study estimates 12-18 elapsed months for a six-to-eight-person build team, subject to sequencing.
- Several growth paths: consumer transfers, business payouts, additional corridors and future platform licensing after validation.

The proposed $18.4 million pre-money price

The same-price primary/secondary proposal implies $20m post-money less $1.6m of new company capital = $18.4m pre-money. The $400k owner share purchase is paid to the owner. This venture price reflects future potential; reproduction cost alone does not establish it. Legal access, delivery economics, reliable operations and repeat usage support the premium case.

Proposed funding structure: $2m for 10% in total, split into $400k owner liquidity and $1.6m company support for the first 1-3 years. Support the price with partner commitments, independent security evidence and pilot cohorts; deploy company capital against reviewed milestones.

Contributor IP assignments, licence terms of dependencies and chain of title should be confirmed in diligence. No comparable funding transaction, audited IP appraisal or investor return is asserted. [I7]

How Tazdan earns revenue

The base scenario monetises transactions after permitted features and partners go live. Each activity below is counted once. The same customer may use several products; the underlying transaction principal is separated to avoid double-counting.

Month-12 stream	Illustrative usage and price	Monthly revenue
Cross-border transfers	2,250 users × $600 volume × 1.8% blended fee + spread	$24,300
Standalone LYD conversion	750 users × $600 × 0.5% effective gross yield	$2,250
Separate crypto exchange	1,250 users × $500 × 2.5% effective gross yield	$15,625
Withdrawals	1,500 chargeable withdrawals × $3 fee	$4,500
Internal business payouts	100 business accounts × 50 payments × $0.50	$2,500
Total	5,000 MAU; blended revenue of $9.835 per MAU	$49,175

Pricing is a commercial assumption

Remittance corridors have configurable spread, fixed and percentage fees; the model uses a 1.8% blended realised fee/spread yield and does not add seeded flat fees. The LYD market maker uses pips, not a fixed 2.5% conversion charge: a 0.05 LYD half-spread would be 0.5% at a purely illustrative 10 LYD/USD reference. Actual capture changes with rates, skew and inventory.

The crypto 2.5%, withdrawal $3 and business $0.50 are modeled realised pricing. They require approved tariffs and correctly charged, reconciled fee postings. Business fees are configurable and can currently default to zero. LYD swap margin journal wiring and testing are a launch prerequisite for that revenue line.

Excluded from base revenue: P2P escrow fees (currently zero), cards/interchange, subscriptions, customer-balance yield, group-wallet or pool returns, DEX execution fees and white-label licensing. These are optional future upside, not assumed cash flow.

Month-12 distinct remittance/FX/crypto volume: $2.425m; business payouts $0.500m are tracked separately. Fee revenue is not transaction principal. [I4,I5,I9,I10]

Margins and unit economics

$9.84
Revenue per MAU in the base case

70.2%
Month-12 gross margin

-9.8%
Month-12 operating margin

Direct cost, month 12	Assumption	Monthly cost
Remittance fulfilment	0.35% of volume + $0.40 per transfer	$5,625
LYD / crypto execution	0.10% / 0.25% of separate volumes	$2,013
Withdrawal / business handling	$1 withdrawal / $0.05 business payment	$1,750
Loss reserve	0.05% of remittance + LYD + crypto volume	$1,213
KYC verification	~1,035 checks × $2	$2,069
Monitoring and infrastructure	$0.10/MAU monitoring; $1,000 + $0.10/MAU infra	$2,000
Total direct costs	Rounded components; exact total shown	$14,669

Gross margin becomes profit only after operating costs

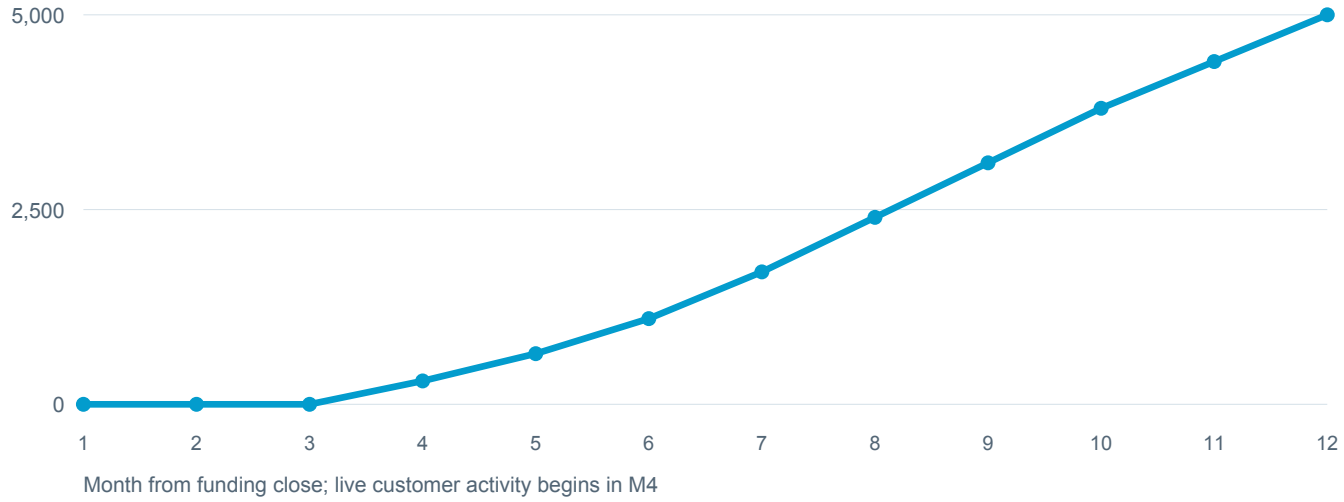

Month-12 gross profit is $34,506. Fixed operating costs of $30,000 and growth spending of $9,312 produce a $4,806 operating loss. Fixed costs cover engineering/product ($10k), founder/business ($4k), compliance/legal ($6k), support/ops ($6k), and security/custody/insurance/admin ($4k).

At the same 5,000 users in a steady state with only 4% monthly churn replacement, modeled KYC and acquisition costs fall. The result becomes approximately $3,642 operating profit, or 7.4% margin. This requires stable activity, pricing and costs; it is not the month-12 growth case.

Gross margin = (revenue - direct costs) / revenue. Operating margin includes recurring team and growth costs, before tax, interest, depreciation and $450k assumed one-time launch spending. Bank/local funding is assumed; card processing is excluded. Partner/insurance costs are not contracted. Sumsub lists a $1.85 compliance check with a $299 minimum; the model allows $2/check but excludes separately negotiated KYB/monitoring extras. [E2]

The route to 5,000 active users

Active means a customer completing at least one genuine permitted money transaction in the preceding 30 days. Downloads, registrations, chat-only visits and sandbox transactions do not count. Business owners are included in the total MAU; 100 active business accounts is a month-12 subset target.

Acquisition assumptions	Base target
Monthly active-user retention	96% (4% monthly churn), an unvalidated assumption
Gross first-time activations during year 1	5,698; includes replacing customers who leave the active cohort
Verified accounts needed	~7,597 at 75% verified-to-active conversion
Registrations needed	~10,853 if 70% of registrations verify
Acquisition spend	60% paid at $20 CAC, 40% organic; $12 blended spend per activation
Year-1 acquisition budget in forecast	$70,376, including $2,000 prelaunch spend

Distribution starts with trust and repeat need

Proposed channels: community referrals and recipient claim links; targeted diaspora and local-market campaigns; and direct onboarding of employers, merchants and supplier-payment businesses. Measure activation, first-to-second transaction conversion, cohort retention, cost per activated user and revenue per cohort weekly.

The channel split is a spending assumption, not secured distribution or measured CAC. Ramp begins only if release gates and the first corridor are accepted by the end of month 3. Delay shifts the revenue curve and consumes runway.

The 12-month financial scenario

Months run from funding close. M1-M3 are preparation; all subsequent revenue is conditional on approved launch in M4.

Month	MAU	Revenue	Direct costs	Gross profit	Operating costs	Operating result
1	0	0	1,000	(1,000)	25,000	(26,000)
2	0	0	1,000	(1,000)	25,000	(26,000)
3	0	0	1,000	(1,000)	27,000	(28,000)
4	300	2,950	2,496	454	31,600	(31,146)
5	650	6,393	3,473	2,919	32,344	(29,425)
6	1,100	10,818	4,821	5,997	33,712	(27,715)
7	1,700	16,720	6,661	10,058	37,728	(27,670)
8	2,400	23,604	8,616	14,988	39,216	(24,228)
9	3,100	30,488	10,315	20,174	39,552	(19,378)
10	3,800	37,373	12,013	25,360	39,888	(14,528)
11	4,400	43,274	13,213	30,061	39,024	(8,963)
12	5,000	49,175	14,669	34,506	39,312	(4,806)
Year 1	5,000[1]	220,796	79,279	141,517	409,376	(267,859)

$220.8k
Year-1 earned revenue

64.1%
Year-1 weighted gross margin

($267.9k)
Year-1 recurring operating result

Read the ramp correctly

Month-12 revenue annualised is $590,100. This is an exit run rate, not year-1 revenue, contracted recurring revenue or SaaS ARR. The ramp produces less revenue in the earlier months and carries preparation costs before the first transaction.

If the assumed $450,000 one-time launch budget is fully expensed, modeled year-1 loss before tax is $717,859. No after-tax net profit is forecast.

[1] Month-12 endpoint, not a sum of monthly users. Figures are rounded; exact values reconcile in the saved model. Direct costs include prelaunch infrastructure; operating costs include acquisition. No regulatory minimum capital, taxes or financing costs are assumed.

Profit potential and sensitivity

The 5,000-user goal does not guarantee profitability. Transaction frequency, corridor economics, fee capture and retention determine whether the platform turns activity into cash contribution.

At 5,000 MAU	Revenue	Gross margin	Operating result	Operating margin
Downside	$21,562	30.6%	($34,212)	-158.7%
Base	$49,175	70.2%	($4,806)	-9.8%
Upside	$71,225	74.1%	$13,431	18.9%

Scenario	What must be true
Downside	30% remit users at $450/1.6%; 15% LYD at $450/0.3%; 15% crypto at $350/2%; 1,250 withdrawals; 50 businesses × 30 payouts. Higher execution costs/losses and 900 new activations.
Base	The activity and yields on page 8 hold; model partner costs and retention are achieved.
Upside	55% remit users at $700/1.9%; 15% LYD at $700/0.6%; 30% crypto at $600/2.5%; 1,750 withdrawals; 125 businesses × 60 payouts. Base cost rates and acquisition spending.

Two routes to operating break-even

- Grow beyond the initial target: approximately 5,920 MAU at base unit economics and the month-12 new-activation rate per user, with fixed operating costs unchanged.
- Improve repeat economics: stable 5,000-MAU activity can generate a modeled 7.4% operating margin when growth spending falls to churn replacement.

The fee and volume levers

At base month-12 volumes, 0.1 percentage point less remittance yield reduces monthly revenue by $1,350; 0.1 point less crypto yield reduces it by $625. A one-point rise in total fulfilment cost on the $1.35m remittance volume costs $13,500 - larger than the base operating loss.

Downside direct costs assume remittance 0.6% + $1, LYD 0.2%, crypto 0.4%, withdrawal $1.50, business $0.10, and a 0.10% loss reserve. Other monitoring/infra rates stay at base. Scenarios are not probability-weighted; tax and one-time launch spending are excluded.

Funding the first 1-3 years

Of the $2m total commitment, $400k buys existing shares from the founder/owner and is paid to the owner. The remaining $1.6m goes into Tazdan to support operations, launch and growth over its first 1-3 years. The company allocation below excludes the owner payment.

Company capital use	Proposed amount	Share of $1.6m
Year-1 recurring operating cash deficit[1]	$268,000	16.8%
One-time legal and provider activation	$250,000	15.6%
Incremental engineering, release and independent assurance	$200,000	12.5%
Corporate settlement/prefunding liquidity[2]	$400,000	25.0%
Contingency	$200,000	12.5%
Years 2-3 support and expansion reserve	$282,000	17.6%
Total new company capital	$1,600,000	100.0%

What remains after the first year

From the $1.6m company capital, base year-1 cash deployment is about $718k for recurring burn and one-time launch spending. Earmarking $400k for corporate prefunding leaves approximately $482k: $200k contingency plus $282k for subsequent support. Prefunding remains corporate liquidity.

Release capital against evidence

Milestone 1: approved legal scope, bank/safeguarding arrangements and contracted first rail. Milestone 2: independent security and money-path acceptance plus recovery/device testing. Milestone 3: controlled live pilot with clean reconciliation. Milestone 4: scale acquisition only after cohort retention and contribution margins meet agreed thresholds.

1-3 year support objective: deploy the $1.6m company funding in reviewed stages. Support through years 2-3 depends on actual spending, launch timing and earned revenue; 36 months of runway is not guaranteed. Settle the separate $400k owner share purchase under the agreed closing terms.

[1] Rounded from $267,859 forecast loss, including growth spend. [2] Corporate capital only; customer principal is excluded. Budgets and proceeds are gross planning amounts; deal costs, regulatory minimum capital and partner collateral need confirmation. Primary capital goes to the company; secondary proceeds go to the selling owner. [E3]

Execution, readiness and risk

Timing	Acceptance objective
Months 1-3	Legal approval for scope; partner and banking contracts; independent review; current release money/device/recovery evidence.
Months 4-6	Capped live pilot; daily reconciliation; 300 to 1,100 active users; support and complaints ownership.
Months 7-9	1,700 to 3,100 MAU; repeat-cohort economics; business activation; contracted rail reliability.
Months 10-12	5,000 MAU and 100 business accounts; measured cost and retention; capacity evidence before further corridors.

Risks that determine the investment outcome

Risk	Mitigation and evidence required
Regulatory / partner access	Issued authorisation for exact activities; signed contracts; approved currencies and corridors.
Customer funds / cyber / custody	Independent pentest and mobile review; money-path race/replay/reversal tests; isolated custody; recovery drill and daily close.
Liquidity / FX / venue exposure	Position and prefunding limits; stale-quote stopping; contracted hedging; treasury stress tests.
Unit economics / acquisition	Tariff acceptance; provider invoices; measured active-user cohorts and losses; pause spend if contribution fails.
Operational / deployment reliability	Named on-call owners; measured alerts and recovery; scoped kill switches; production capacity acceptance.

Current status: substantial implementation exists, but a broad real-money launch is not evidenced. Remittance rails are sandbox, issuer/PSP activation is pending and money features default to gated/off configurations. Production access is conditional on release-bound evidence and explicit feature scope.

Schedule assumes approvals and partners by month 3, a planning assumption rather than an approval timetable. One first corridor can launch while other features stay gated. Historical readiness reports are supplemented by the current scoped-release runbook. [I2,I3,I8]

Feature catalogue: customer money

Implemented means source workflows exist. Live availability still depends on approved release scope, configuration and any stated external dependency.

Capability group	Features and practical scope
Account and security	Registration/login; email verification and recovery; TOTP 2FA/recovery; device/session management; biometric app access; risk-based confirmation; security preferences. SMS/WhatsApp needs activation.
Wallets and portfolio	Fiat USD/EUR/GBP/AED/SAR/EGP/LYD and crypto/stablecoin balances; portfolio valuation; activity/history; supported currency views; balance privacy.
Internal payments	Payments to eligible Tazdan users; handles/contact lookup; notes; chat payments; receipts/history; minimum and risk limits.
Claim links	Public preview before account creation; optional PIN; protected claim; expiry; cancellation and refunds.
Bank money movement	Customer bank accounts; deposits to staff-entered platform accounts with confirmation; screened withdrawals and staff approval/manual payout. Requires real bank accounts and operating process.
Crypto funding	Deposit addresses; detection/confirmation for supported networks; linked external-wallet records; on-chain withdrawals subject to custody, RPC and release activation.
Savings and habits	Budget wallets/goals; contributions/withdrawals; scheduled contributions; recurring crypto purchases depend on trading activation.
Records and service	Statements; CSV/JSON exports; portfolio history; notification preferences; in-app/push/email notices; guides; support escalation.
Account lifecycle	Profile settings; public profiles/search; obligations checks; confirmed account closure and retention/anonymisation workflow.

Customer-money evidence: mobile/app and mobile/src; server routes for auth, wallets, transfers, messages, claim links, bank accounts, deposits, withdrawals, crypto wallets, budgets, recurring buys, exports and account closure. Feature states reviewed against current code, not just the older matrix. [I2,I3]

Feature catalogue: exchange and reach

Capability group	Features and availability
Trading and conversion	Own-wallet conversion; executable buy/sell pricing; previews and minimum received; locked single-use crypto quotes; fee/spread disclosure; idempotent execution; orders and recurring buys. Trading activation and real hedge venue required.
LYD pricing engine	Fulus reference; pip-based bid/ask; flow-sensitive skew; netting and per-user caps; stale-rate widening/stopping; shared Redis coordination; maker-checker configuration; cockpit visibility. Swap fee journal completion remains required.
P2P marketplace	Offers/listings, distance sort, escrow, payment confirmation, cancellation, disputes and merchant reputation. Production gated; current escrow fee is zero.
Market and social	Asset search/data/charts/news; authenticated asset discussions, replies, likes, reporting and moderation; direct chat, read status, edit/delete, block/report and privacy controls.
Remittance experience	12 sandbox corridor configurations; beneficiaries and bank validation; locked quotes; fixed/percentage fees, spreads and tier discounts; limits, purpose and source-of-funds thresholds; neutral status tracking.
Remittance execution	23-state lifecycle; screening/manual review; route ranking; treasury reservation/prefund; callbacks/polling; unknown outcomes; retries/cancellation/refunds/returns; provider-statement reconciliation. All external rails await activation.
Cards and card funding	Virtual/physical card interfaces; tiers, controls, freeze/cancel, top-up/order, activity/cashback and budget funding. PSP adapters and mobile pay configuration exist. Issuer/PSP contracts and production adapters required.
Reach and experience	Referral/reward workflows; light/dark/monochrome themes; nine locale dictionaries including Arabic; contact discovery and announcements. Localisation acceptance still requires device QA.

Supported withdrawal broadcast paths include ETH/USDT-ERC20, BTC and SOL, subject to isolated remote custody and release acceptance. TRON withdrawal broadcasting is incomplete; not every tradable asset is withdrawable. Read-only DEX quotes are not an executable DEX product. [I2,I3,I5,I9,I10]

Feature catalogue: business and staff

Capability group	Features and practical scope
Business onboarding	Business profile/dashboard; KYB submission and compliance review; payout verification gate. Automated vendor checks require activation; company-document upload is not represented as complete.
Teams	Invitations/acceptance/removal; OWNER, ADMIN, DEVELOPER and ANALYST permissions; API keys tied to current member roles.
Business payouts	Preview/validation/fees; reserve full batches; maker-checker; single-signatory step-up; human approval for API batches; compliance holds/release; cancellation; atomic lines and partial outcomes. Internal Tazdan recipients only.
Developer platform	Hashed/scoped/expiring/revocable keys; public balances/rates and single/bulk payouts/status APIs; write idempotency; webhook management; signed delivery, retries/backoff, dead-letter state and network restrictions.
Customer operations	Staff overview/search/Customer 360; PII masking; customer freezes/session revocation; business review; transaction detail; deposit/withdrawal/KYC queues; support assignment/reply/resolution.
Money operations	Ledger accounts/journals; remittance queue/retry/refunds/corridors; FX prices/overrides; treasury pools/movements/thresholds; reconciliation exceptions and approvals.
Risk operations	17 default risk rules; screening/name matching and Arabic normalisation; watchlist import; cases, evidence, owners and SLAs; fraud/linked-account/device views and withdrawal review. Screening data must be activated.
Platform operations	Providers/mode/health/circuit breakers/call logs; finance/take-rate/cost views; statistical forecasts with sufficient data; health/security/audit views; staff roles; mobile admin.
Dual control and AI	12 staff roles/49 permissions; privileged-action audit; sensitive adjustments/refunds/FX require separate approval; scoped kill switches. Optional read-only AI assistant, 13 tools, case/support drafts with human acceptance; off by default.

External-bank business payouts are not built as a separate service and would use activated remittance rails. Statistical projections need actual historical activity. AI is optional and subject to provider agreement, permissions and privacy configuration. [I4,I6,I11]

Feature catalogue: financial controls

Control group	Built mechanisms / limits
Accounting integrity	Double-entry journals checked at database commit; customer, settlement and corporate classifications; fees, holds/reservations; asset ledger; continuous reconciliation and trading halt on drift.
Evidence and state	Append-only ledger/audit/security/treasury/lifecycle evidence; immutable quotes; conditional transitions; idempotent remittance/business/API writes and operation references.
Provider safety	Explicit live/sandbox/mock registry; production guards; circuit breakers; callbacks, polling, retry and reconciliation; an unavailable outcome is resolved before another payout.
Identity and surface	TOTP/step-up, credentials/session controls, permission checks, rate limits, guarded webhooks, upload controls, API key scopes and PII masking. These require independent assurance, not implied certification.
Custody and crypto risk	Key/seed-protection and custody interfaces; production remote-custody requirements; withdrawal screening/approvals; configured principal crypto exposure limits. Venue availability and key recovery require acceptance.
Deployment and continuity	Docker/TLS; CI dependency/secret/migration checks; live/ready/metrics endpoints; backup/recovery/PITR and rollback tooling; release-scoped evidence manifest. Recovery and notification drills still required.
Release governance	Legal/provider/security/money-path/device/recovery/operations evidence bound to release SHA; dated reviews and scope; feature/currency/corridor/provider/customer controls; fail-closed new-money access.

Development opportunities excluded from base claims

Group-wallet/liquidity-pool controllers are unmounted; passkey/FIDO2 server support is not evidenced; executable DEX swaps, complete automated safeguarding reconciliation, automated SAR/STR or Travel Rule messaging, and second-region failover are not represented as delivered. Future subscriptions and platform licensing need product and customer validation.

No SOC 2/ISO certification, completed independent audit, operating licence, confirmed partner network or audited traction is implied. Source controls are valuable; their effectiveness in live operations must be established with current independent evidence. [I3,I7,I8,I11]

Evidence and model notes

Internal sources below are available in the project data room. Current code is an uncommitted working-tree review dated 13 October 2026; written October 7 assessments are historical. No current production deployment or contracts were inspected.

72-122 engineer-month assumption; reproduction scope and exclusions.

I2 docs/audit/FEATURE_MATRIX.md
Historical state matrix; current source spot-checks override stale claims.

I3 docs/runbooks/launch-readiness.md
Current release gates, required acceptance evidence and pilot scope.

I4 docs/BUSINESS.md; server/src/services/business/
KYB, internal payouts, roles, API and fee implementation.

I5 docs/REMITTANCE.md; server/src/services/remittance/
Sandbox corridors, pricing, state lifecycle and revenue recognition.

I6 docs/CONTROL_COCKPIT.md; docs/LEDGER.md
Staff operations, permissions and money controls.

I7 docs/dataroom/03_IP_INVENTORY.md; docs/dataroom/18_SCALABILITY.md
IP/title checks and capacity limitations.

I8 server/prisma/schema.prisma; server/prisma/migrations/
Current static counts and ledger/evidence constraints.

I9 docs/FX.md; server/src/services/exchange/
Current pip pricing, principal exposure and fee capture.

I10 server/src/controllers/p2p.controller.ts
Current zero-fee escrow implementation.

I11 docs/AI_AUTOMATION.md; server/src/services/platform/
AI permission boundaries, controls and configuration.

External checks - accessed 13 October 2026

E1 U.S. Bureau of Labor Statistics, Software Developers (May 2024 wage data).
bls.gov/ooh/computer-and-information-technology/software-developers.htm

E2 Sumsub published pricing: Compliance $1.85/check, $299 monthly minimum.
sumsub.com/pricing/ - reference cost only; no partnership or jurisdictional eligibility asserted.

E3 Carta, The secondary market, explained: primary proceeds fund the company; secondary proceeds belong to the selling shareholder.
carta.com/learn/equity/liquidity-events/secondary-transactions/

Interpretation of the financial model

Every forecast input is an illustrative planning assumption. Fractions of users/checks are expected averages, not actual people. Revenue is earned fees and spread; all principal, balances, card income, subscriptions and P2P fees are excluded unless explicitly modeled. Proposed tariffs and fee posting must be accepted before launch. Reported margins exclude tax, financing and depreciation; one-time launch costs are shown separately. Investor ownership and returns depend on definitive terms and future dilution.

Screenshots are unaltered repository app captures, resized for print. They illustrate UI rather than verified account values, live delivery or customer traction. The saved build source and exact monthly model allow the projections to be revised when partner quotations and pilot evidence arrive.
