tazdan

INVESTOR OVERVIEW · NOVEMBER 2026

Pay, send and hold money at the real rate. Built for Libya.

tazdan is a Libyan money app: pay shops by QR or @username, send to people, hold dinars and dollars side by side, and run a business account, in Arabic and English.

Total round	Into the company	To the founders	Investor ends with
$19,000,000	**$11M of new shares**	**$8M for 20% of their shares**	**37.3%**

Confidential. For discussion with prospective investors only; not an offer of securities. Projections are model estimates, not forecasts or promises. Screens show a demo account with fictional people, businesses and balances.

AT A GLANCE

One app for everyday money in Libya

Libyans juggle cash, bank queues and two exchange rates. tazdan puts payments, transfers, savings and the real market rate in one app, with business accounts that let any shop accept payment from a single QR code.

88	424	97	398
app screens, Arabic and English	API routes	data models, 59 migrations	automated tests in 51 suites

Why now

- Demand for foreign currency is large: the Central Bank of Libya reports **$19.34 billion** of foreign-exchange use in January–September 2026, **$6.51 billion** of it for personal purposes and **$2.68 billion** for transfers.
- Everyday prices follow the parallel market, yet most apps show the official rate. tazdan shows a live market rate and the spread, before anyone confirms.
- Shops still run on cash. A permanent QR code, a Wallet card and an instant receipt make accepting digital payment as simple as showing a sticker.

What is built

The product is built and tested end to end: payments and the Pay tab, multi-currency wallets, chat with payments, savings goals, business accounts with bulk pay and approvals, an exchange flow, remittance corridors in sandbox, a staff control cockpit with maker-checker and kill switches, and home-screen widgets.

Where it stands

Pre-launch. Real-money activity stays switched off in production until nine release gates are cleared with evidence: authorisation, providers, safeguarding, treasury, security, money paths, device QA, recovery and operations. The licence process with the Central Bank of Libya is in progress; bank partners are in discussion.

The ask

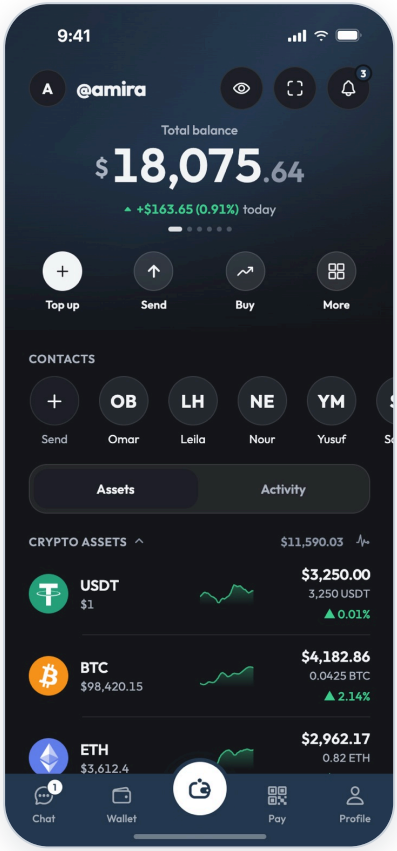

$19 million in total. $11 million of new shares funds the company for its first three years: launch, licensing, the team and payout liquidity. $8 million buys 20% of the founders' existing shares and is paid to the founders, not the company. Both parts are priced at $40 million pre-money; the investor ends with 37.3%.

PRODUCT

The app, screen by screen

Captured from the current build. Every screen is real; the account, people, shops and balances are fictional. Status shows what is live in the code today and what waits for a partner, licence or switch.

Demo account · fictional data

Demo account · fictional data

01

Home and balances

Built

Everything you hold in one balance, with contacts and recent activity a thumb away.

- Total balance in the display currency you choose, and each currency on its own page.
- Top up, Send, Buy and More one tap from the top.
- A contacts row for paying the same people again.
- Assets and activity with live prices and the 24-hour change.
- Privacy mode hides balances in public; prices stay visible.

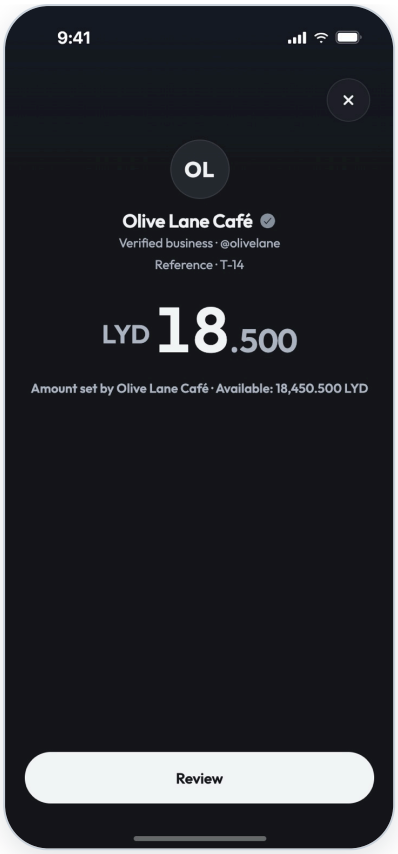

02

Pay: scan or @username

Built · new

The tab that replaced P2P: pay a shop or a person in seconds.

- One large Scan to pay button for the till.
- Search by name or exact @username; private profiles show only a first name and last initial.
- Recent payees, with a check mark for verified businesses.
- A shop's name and logo appear only after business verification (KYB), so a fake shop name can't fool a customer.

Demo account · fictional data

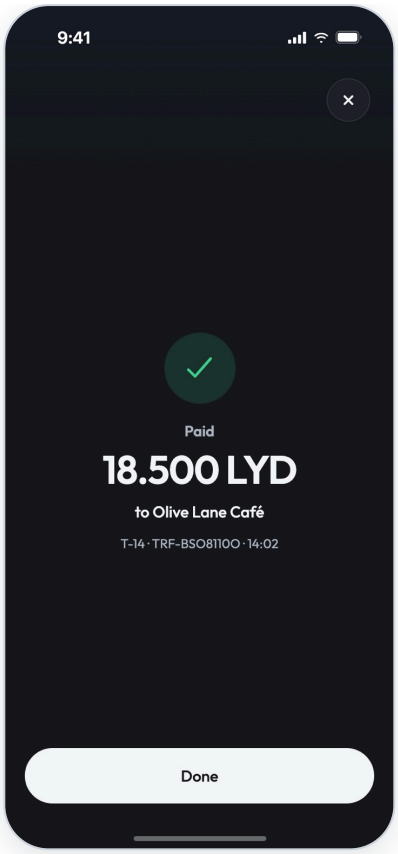

03

Paying a shop's code

Built

A shop's code can carry the amount and its own reference, so the customer only confirms.

- Verified business name, @handle and reference shown before any money moves.
- Amount and currency fixed by the code: no typing, no mistakes.
- Spending limits checked before Face ID or any security code.
- One review, one confirmation; a retried payment is never charged twice.

Demo account · fictional data

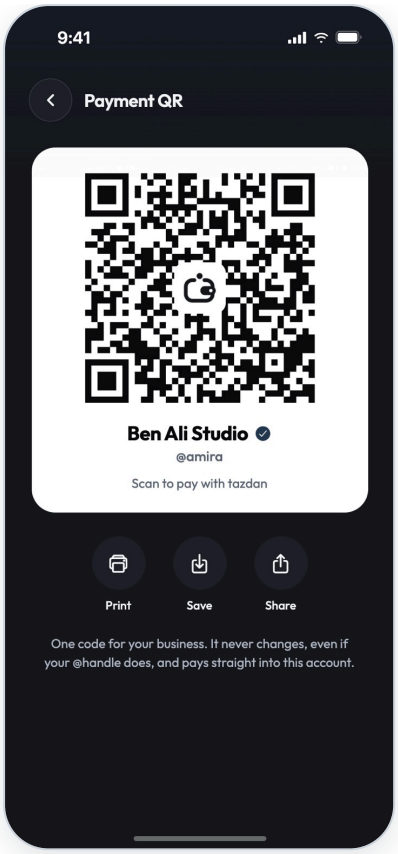

04

A receipt for the counter

Built

A confirmation the cashier can read at a glance.

- Amount at the currency's precision: dinars to three decimals.
- Payee, the shop's reference, the tazdan transfer reference and the time.
- Stays on screen until Done, so it can be shown at the till.
- The payment appears in both sides' activity and statements.

Demo account · fictional data

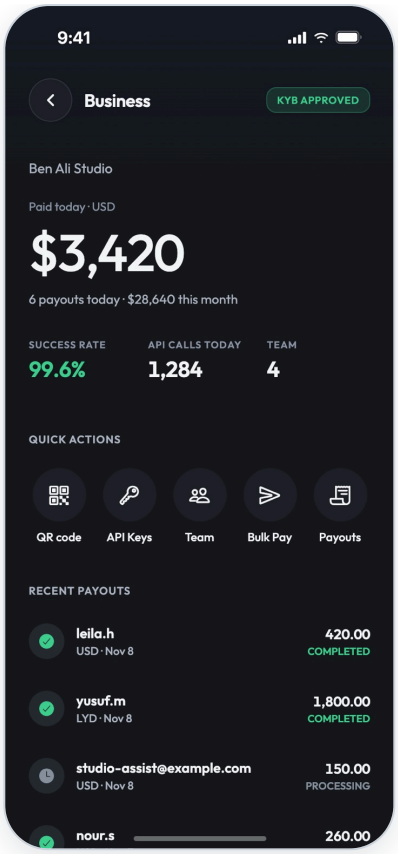

05

One QR code per business

Built · Wallet cards need Apple and Google issuer setup

Every business gets one permanent code to be paid into.

- Linked to the business account itself, not its @handle: a printed sticker keeps working after a rename and can never be taken over.
- Print a counter poster, save the image or share the link.
- Add it to Apple Wallet or Google Wallet to show as a card; issued only to verified businesses.
- Any team member can open it; the money always lands in the business account.

Demo account · fictional data

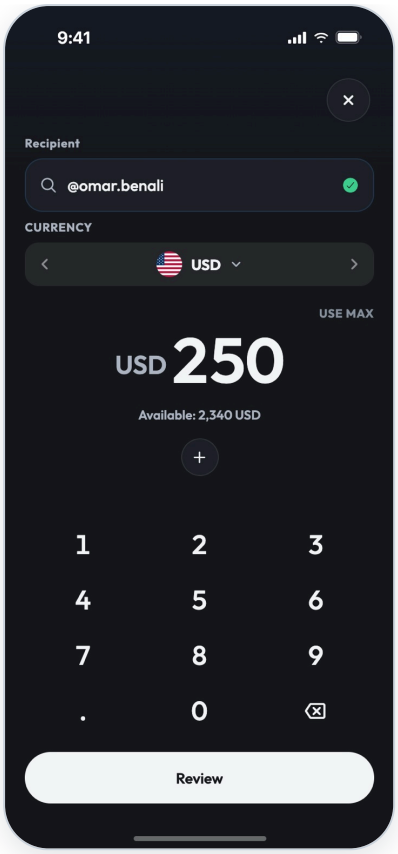

06

Business accounts

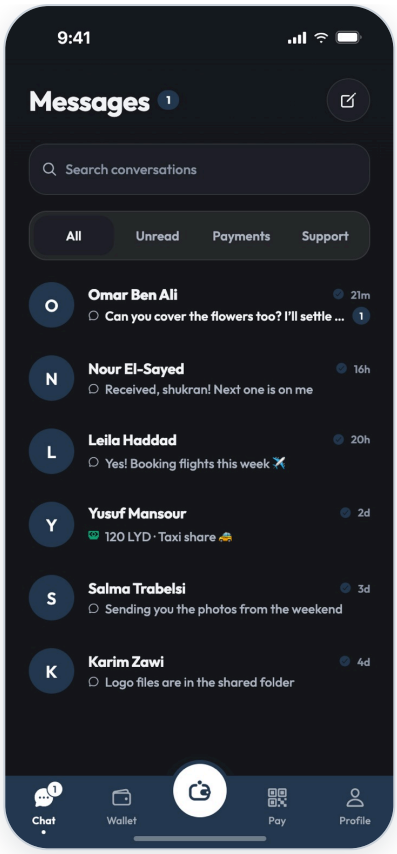

Built · tazdan recipients

A dashboard for verified businesses: what came in, what went out, and who may do what.

- Verification (KYB) status and today's volume.
- Bulk pay to many tazdan accounts in one batch.
- A second approver above a set threshold (maker-checker).
- Team roles (owner, admin, analyst, developer), API keys and signed webhooks.

Demo account · fictional data

Demo account · fictional data

07

Send to anyone

Built

Pay a person by @handle or from contacts, in any currency you hold.

- Pick the person and the currency, then type the amount on a large keypad.
- The recipient is checked before you confirm, not after.
- Not on tazdan yet? Send a claim link they redeem after signing up.
- If the connection drops mid-payment, the money never goes twice.

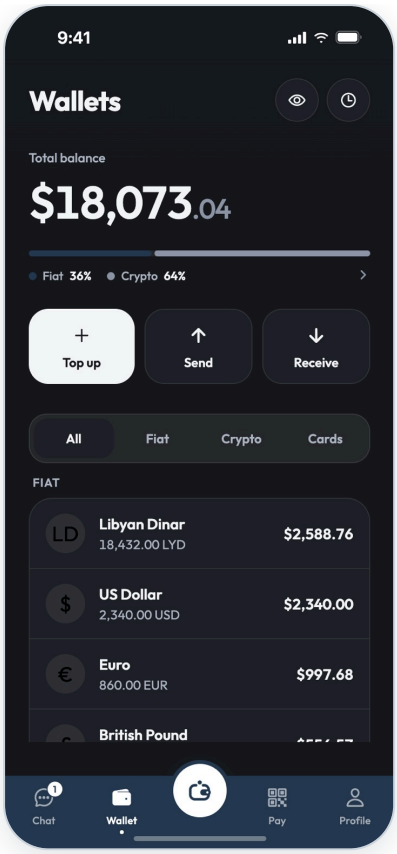

08

Chats with money built in

Built

Conversations and payments live in the same place.

- Unread counts, payment and support filters, pinned chats.
- Pay inside a chat; the receipt appears in the thread.
- Delivery built for weak networks: retries, catch-up after reconnecting, no duplicates.
- Push notifications with control over message previews.

Demo account · fictional data

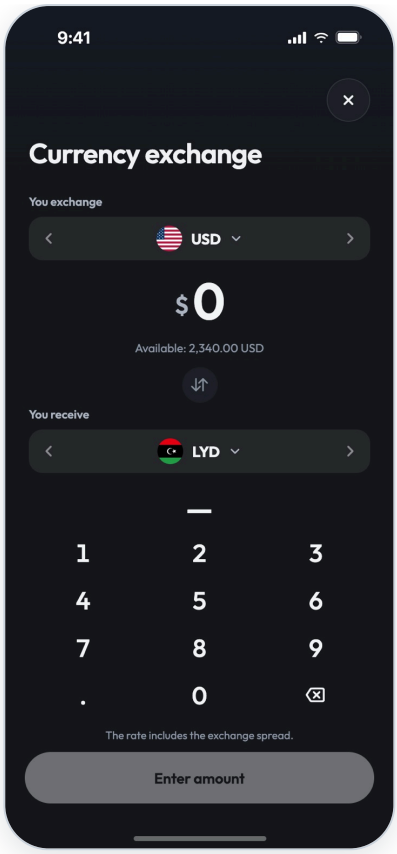

09

Multi-currency wallets

Built

Dinars, dollars, euros, pounds and digital assets side by side.

- Each balance valued in the display currency at live rates.
- The split between currencies and digital assets at a glance.
- Top up, send and receive from the same screen.
- Full history and audit-ready PDF statements.

Demo account · fictional data

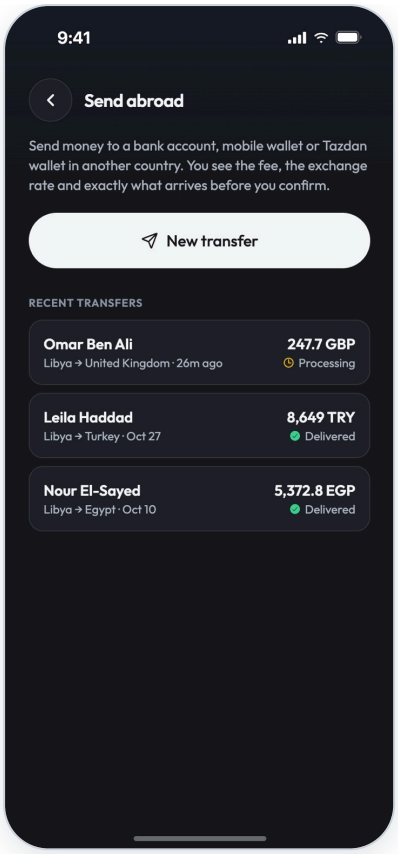

10

Exchange at the real rate

Built · awaits FX permission

Convert between currencies at a live market rate, with the spread stated before you confirm.

- The dinar rate comes from a real-time parallel-market feed, with fallbacks.
- The rate includes the spread, and the app says so plainly.
- Market-maker settings, rate-jump guards and kill switches for staff.
- Switched on only with lawful FX permission.

Demo account · fictional data

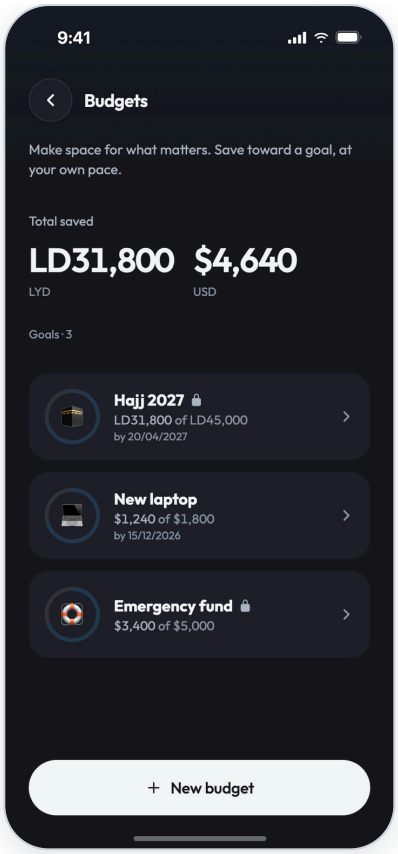

11

Send abroad

Sandbox · payout partner pending

Quote, recipient, review and tracking across twelve configured corridors.

- The UK, Turkey, Egypt, the UAE, the euro area, Tunisia and more are configured.
- Fee, rate and exactly what arrives, shown before confirming.
- A status timeline from compliance check to delivery.
- Goes live corridor by corridor, once a licensed payout partner signs.

Demo account · fictional data

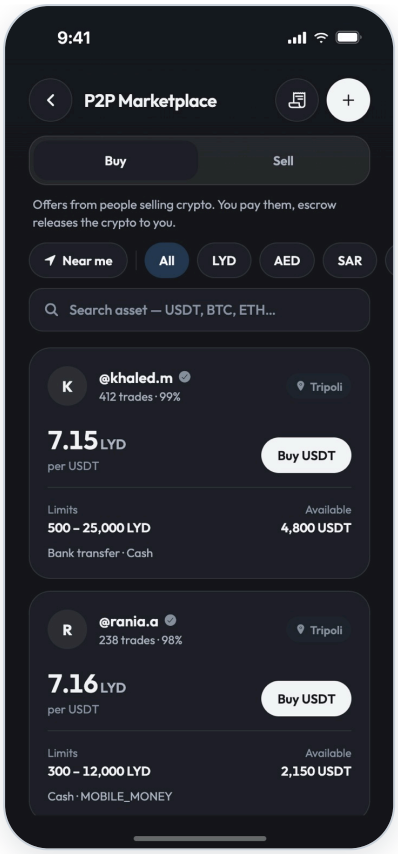

12

Savings goals

Built

Goals like Hajj 2027, with scheduled contributions and an optional lock.

- A target amount and date, with progress.
- Automatic contributions on a schedule.
- Lock until a date, to protect savings from spending on impulse.
- The money stays in the customer's wallet, set aside for the goal.

Demo account · fictional data

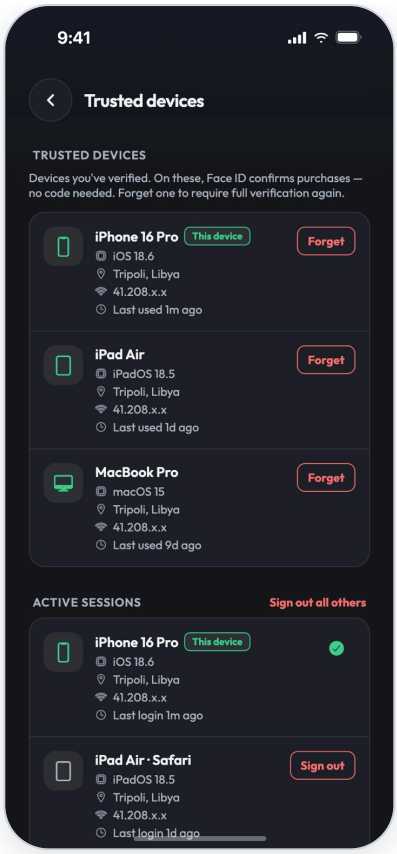

13

P2P market, now under More

Built · off by default in production

Person-to-person offers with escrow and disputes, moved off the tab bar when Pay took its place.

- Buy and sell offers with price, limits and payment methods.
- "Near me" uses a coarse area only, never an exact location.
- Sellers show a first name and last initial.
- Escrow, chat and disputes; staff can pause it at any time.

Demo account · fictional data

14

Security centre

Built

Two-factor authentication, trusted devices and remote sign-out.

- See every signed-in device and sign the others out.
- Two-factor authentication with an authenticator app, with recovery.
- Extra checks (Face ID or a 6-digit code) for new devices and large amounts.
- Three identity-verification levels, with limits shown before every confirmation.

Also built

- Claim links: send to someone not yet on tazdan; they join to claim
- Audit-ready PDF statements by period and currency
- Referrals with tracked invites
- Home-screen widgets for payments, chats and prices (iOS and Android; ships with the next native build)
- Cards: virtual and physical controls (off until an issuer signs)
- Recurring buys and digital-asset trading (real-money execution switched off)
- Control cockpit for staff: roles and permissions, maker-checker, sanctions lists, fund-integrity checks, exposure limits and kill switches

BUSINESS MODEL

How tazdan earns

Three revenue lines in the model, plus merchant payments as upside that the numbers below do not include.

Cross-border transfers and FX	A 0.10% fee plus a 0.35% markup on the reference rate (base case), kept under a 0.50% all-in guardrail.
Business software	Subscriptions for institutions using the platform: $120,000 a year in the base case, after a $25,000 paid pilot.
Projects	Integration and rollout work for business clients.
Merchant payments (not in the model)	Paying a shop inside tazdan is free today, to win the habit. Merchant pricing is upside on top of these projections.

Worked example: one transfer (base pricing)

Customer sends	6,000 LYD
Explicit fee (0.10%)	6 LYD
Recipient receives	$995.52
Gross revenue	$4.48
Partner share	($0.45)
Retained revenue	$4.04
Payout rail, expected loss and FX slippage	($2.40)
Contribution per transfer	**$1.64**

The model uses a reference rate of 6 LYD per dollar for this example. All-in charge to the customer: 0.45%.

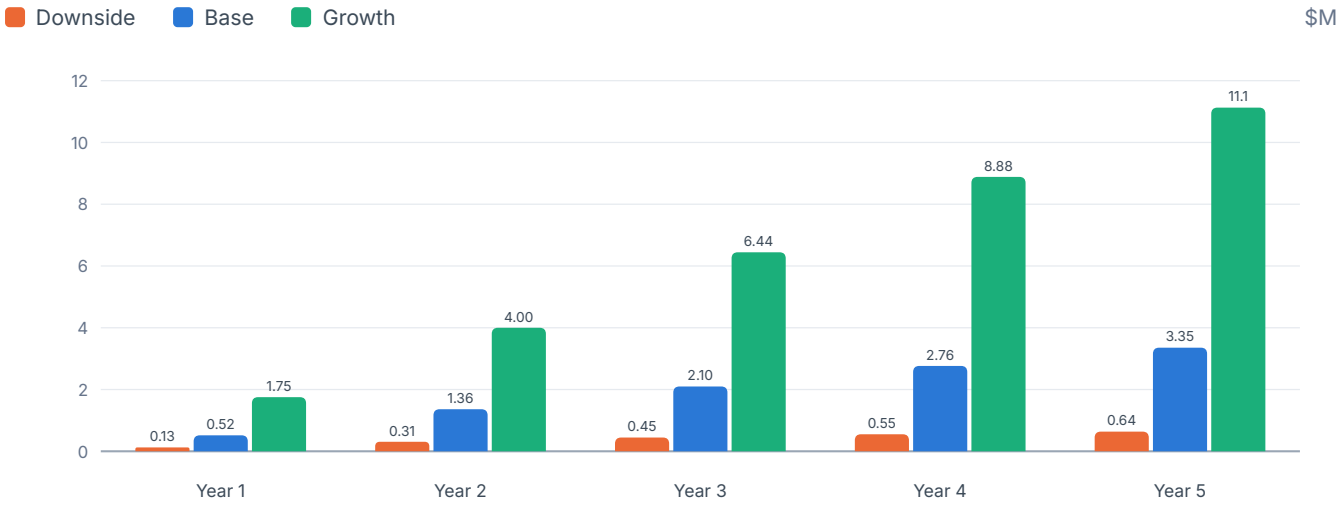

Lifetime value of an international-transfer customer: about $418 at an average transfer of $5,500 (1.3 transfers a month, 3.5% monthly attrition), against a $30 acquisition cost recovered in about 2 months. The five-year projections deliberately use a lower $750 average; at that size a customer contributes about $41, which is why business software carries the margin in the numbers that follow.

FINANCIAL PROJECTIONS

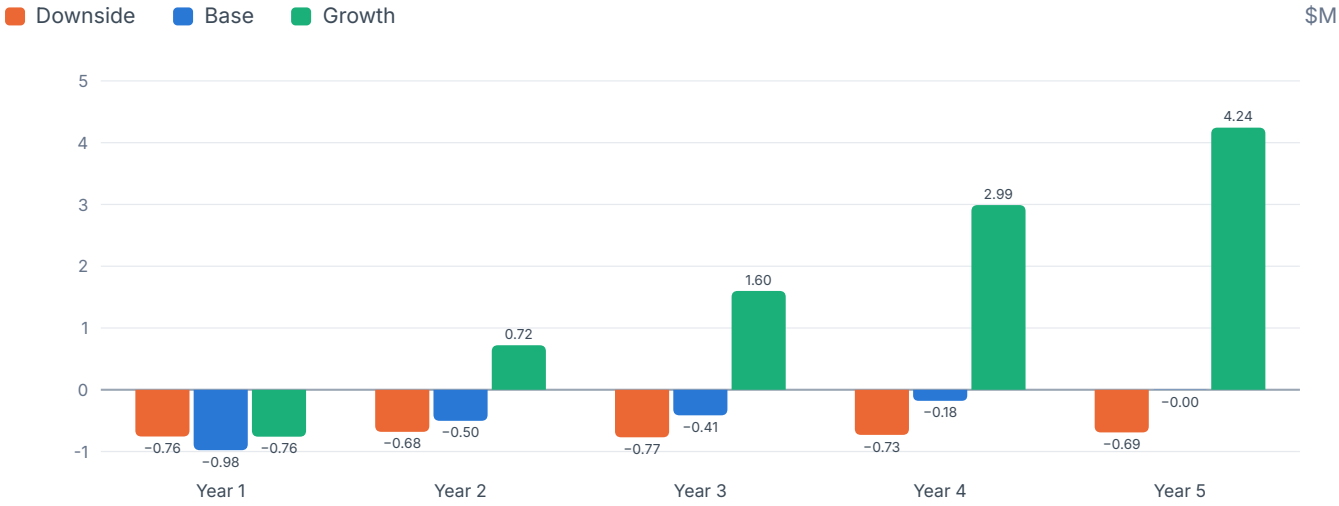

Five years, three cases

From the 60-month operating model. The base case reaches operating breakeven in year 5; the growth case is profitable from year 2. These are estimates built on stated assumptions, not forecasts.

Revenue by year, $ millions

Operating result by year, $ millions (after launch setup costs)

Case	Revenue Y1	Revenue Y3	Revenue Y5	Result Y5	5-yr result	Customers Y5	Business clients Y5
Base	$0.52M	$2.10M	$3.35M	−$0.00M	−$2.08M	25,626	16
Growth	$1.75M	$6.44M	$11.13M	$4.24M	$8.79M	70,339	37
Downside	$0.13M	$0.45M	$0.64M	−$0.69M	−$3.63M	5,309	7

Key assumptions (base case)

- Launch in month 6; 10 staff in year 1 rising to 22 by year 5, at $4,000 loaded cost a month.
- Average transfer $750, 1.3 transfers per active customer a month, 3.5% monthly attrition, $30 to acquire a customer.
- Pricing 0.10% fee + 0.35% FX markup; 10% partner share; payout costs and expected losses deducted.
- Business clients from month 4, one new client a month on average; $120,000 a year each.
- Settlement prefunding: 5 days of converted volume × 1.5 for stress, funded with the company's own capital — never customer money.

What the $11 million funds

The $11 million of new money is sized for three years. In the base case the company still holds **$3.98M** of free cash at the end of year 3, after its operating losses, a $1 million regulatory reserve and payout prefunding. From year 4 revenue pays the running costs — **94%** of them in year 4, with breakeven in year 5 — so no further equity is needed: free cash is still **$1.52M** at the end of year 5 while payout prefunding grows to $6.2M. Prefunding is working capital that comes back when volume falls or a bank facility replaces it. The growth case is profitable from year 2, but its prefunding grows with volume, so it needs a settlement facility of about $4.8M by year 5; the downside case keeps $5.4M of free cash. The $8 million share purchase goes to the founders and is not part of these figures.

STATUS AND RISKS

What has to be true before launch

Stated plainly, because they decide the timeline. The code enforces the first one: production refuses new money activity until every gate has dated, reviewed evidence.

Area	Where it stands	What clears it
Licence	Process with the Central Bank of Libya in progress	Issued permission or an approved regulated-partner arrangement
Partners	Bank accounts, payout partners and a card issuer not yet signed; banks in discussion	Signed agreements and tested connections, corridor by corridor
Liquidity	Payout pools need the company's own capital	This round covers the base case; a settlement facility if volume grows faster
Ledger	A historic ~2,444 USDT discrepancy in test data is being investigated	Independent explanation and approved correcting entries before launch
Security	Hardened, with automated tests; no external penetration test yet	Independent test, fixes, and secret rotation
Team	Small founding team; key-person dependency	Hiring funded by this round
Market	FX policy changes can move the parallel rate and demand	Diversified revenue: business software and merchant payments

THE ASK

$19 million: $11M into the company, $8M to the founders

Total	$19,000,000
New money (primary)	$11,000,000 of new shares, funding the company for three years
Share purchase (secondary)	$8,000,000 paid to the two founders for 20% of their existing shares. This money goes to the founders, not the company.
Price	$40 million pre-money for both parts (the same price per share) · $51 million post-money
Ownership after closing	Investor 37.3% (15.7% bought from the founders + 21.6% new shares) · founders 62.7%
Focus	Libya in years 1–3; North Africa and the Gulf from year 4
Governance	To be agreed in the term sheet
Conditions	Due diligence, definitive agreements, investor KYC, anti-money-laundering and sanctions screening, and any regulatory approvals required. The share purchase and the new money close together.

Use of the $11 million

Settlement prefunding and payout liquidity The company's own money in payout pools so recipients are paid on time. Covers the base-case peak ($6.21M in year 5) without a bank facility. Recoverable working capital.	$6.2M
Operating runway, years 1–3 Team, compliance, technology and marketing until revenue covers costs. Base-case cumulative operating losses: $2.08M over five years, including launch setup.	$2.1M
Regulatory and partner collateral Reserves and deposits that licensing and payout partners require.	$1.0M
Contingency Delays in licensing or partner onboarding, or faster growth.	$1.7M
Total	**$11.0M**

What the new money funds

- Licence, or an approved regulated-partner arrangement, for payments and FX in Libya.
- Clear the nine release gates and switch on real money for a scoped pilot.
- Roll out Pay and the business QR with the first verified businesses.
- First live cross-border corridor with a licensed payout partner.
- Base-case plan: about 10,419 active customers and $1.36M revenue in year 2.
- From year 4, revenue pays the running costs: 94% of them in year 4 and breakeven in year 5 (base case).

Confidential. For discussion with prospective investors only; not an offer of securities. Projections are model estimates, not forecasts or promises. Screens show a demo account with fictional people, businesses and balances.
